

Hospital Management System Normalization Report

First Normal Form (1NF)

- All attributes contain atomic values.
- No repeating groups.
- Each record is uniquely identified using a primary key.

Example:

Instead of storing:

Medicine1, Medicine2, Medicine3

Separate rows are stored in Prescriptions table.

Second Normal Form (2NF)

- Database is already in 1NF.
- All non-key attributes are fully dependent on primary keys.
- No partial dependency exists.

Example:

Doctor information depends only on DoctorID.

Third Normal Form (3NF)

- Database is in 2NF.
- No transitive dependencies exist.

Example:

DepartmentName is stored in Departments table instead of Doctors table.

This reduces redundancy and improves maintainability.
